### Stakeholders Platform Meeting (Zoom)

## 'Improving Environmental Management in the Mining Sector of Suriname with Emphasis on Artisanal and Small- Scale Goldmining' (EMSAGS) - Project

Date: 20 oktober 2022

Time: 09:00 a.m. – 13:15 p.m.

Location: Banquet hall Torarica

---

### Participants

The SP meeting was attended by representatives of:

- Ministries,
- Indigenous and Tribal peoples,
- Private sector,
- Small and large-scale mining organizations,
- NGOs, and
- Anton de Kom University.

## Agenda

| AGENDA                  |  |
|-------------------------|--|
| 9:00 – 9:30 a.m.        | Registration   |
| 9:30 – 9:40 a.m.        | Welcome  |
| 9:40 – 9:50 a.m.        | Opening by Acting General Directeur NIMOS, Mr. Cedric Nelom  |
| 9:50 – 10:30 a.m.       | Presentation dissertation: <i>“The influence of prenatal exposure to non-chemical and chemical stressors on birth outcomes in Suriname”</i><br>By: Dr. Anisma Gokoel   |
| 10:30 – 11:15 a.m.      | Presentation: <i>“Rosebel Goldmines NV management of Small Scale Mining”</i><br>By: MSc. in Mineral Geoscience, Ms. Marijke Agwense of IAMGOLD/ Rosebel Gold Mines   |
| 11:15 a.m. – 12:00 p.m. | Presentation: <i>“Mercury background values in soils and saprolites in the gold-rich greenstone belt of Suriname, Guiana Shield: The role of parent rock and residual enrichment”</i><br>By: Prof. Salomon Kroonenberg |
| 12:00 – 12:15 p.m.      | Recap and Next meeting- EMSAGS PMU.<br>Closing by the Permanent Secretary of Mining, Ministry of Natural Resources, Ms. P. Simons  |
| 12:15 – 13:15 p.m.      | Lunch  |

## Welcome and Opening

The Stakeholder Engagement Specialist, Ms. C. Elliott- Banai, welcomes the participants at 10:00 and informs that due to unforeseen circumstances, the Director of NIMOS is unable to open the meeting.

### **Presentation 1: “The influence of prenatal exposure to non-chemical and chemical stressors on birth outcomes in Suriname”**

In this presentation Dr. Anisma Gokoel discusses the prenatal exposure to non-chemical and chemical stressors in pregnant women.

See annex 1 for the presentation.

| No. | Questions / Comments   | Answers   |
|-----|--|---|
| 1.  | <p><b>Artisanal Gold Council – Marieke Heemskerk:</b></p> <p>a. Is it possible for a pregnant woman in Suriname to get tested for mercury levels in the blood?</p> <p>b. Does the Medical Mission carry out proactive testing in high risk groups?</p>   | <p><b>Anisma Gokoel:</b></p> <p>a. Not sure if the Central Lab can test for mercury levels in blood. Mercury levels in the hair can be tested at the National Zoological Collection Suriname (NZCS). For this research into mercury concentrations in the blood, blood samples were sent to a laboratory abroad.</p> <p>b. Not sure if this is already being done by the Medical Mission.</p>   |
| 2.  | <p><b>Chantal Landburg:</b></p> <p>Did you notice anything about the Apgar score of the children whose mothers had high levels of mercury?</p>   | <p><b>Anisma Gokoel:</b></p> <p>No direct relationship has been identified. The absolute number with a low Apgar score was 15. Most children had a good Apgar score. The number was also much too small to see an association. We did see that there was an association with early birth.</p>   |
| 3.  | <p><b>Camp Mining – Melleo Naana:</b></p> <p>In the city there are many gold buying companies that buy and process gold almost every day. My conclusion is that the pollution in Paramaribo will be much greater because gold is not processed every day in the interior. Where do you make the connection between the result of your research in the interior and the many gold buying companies in the city.</p> | <p><b>Anisma Gokoel:</b></p> <p>During the research, various regions such as Paramaribo and the surrounding area, Nickerie and the Interior were also examined. No significance was found, so no statement can be made about where it occurs most often. The high mercury levels mainly occurred among the indigenous and tribal peoples. I agree with you that gold is processed daily in Paramaribo, which also pollutes our atmosphere. It could be that the</p> |

|    |  |   |
|----|--|---|
|    |  | pollution is more than the Interior, but more research is needed for that.  |
| 4. | <p><b>Anton de Kom University – Rene Artist:</b></p> <p>In your presentation you noted that a mental discomfort has been observed mainly among some of the female inhabitants of the interior. What is meant by mental discomfort, why especially in that group and what is the cause?</p>   | <p><b>Anisma Gokoel:</b></p> <p>The results you mention were found in the study by Gunther et. al. What I conclude from this is that psychological discomfort was tested by means of a questionnaire and that depressive symptoms occurred. We looked at which socio-demographic variables are associated with psychological discomfort. This showed that the interior residents had a higher chance of experiencing psychological discomfort. This research was not only conducted in the interior, but a sample was drawn from the whole of Suriname.</p> |
| 5. | <p><b>Artisanal Gold Council – Marieke Heemskerk:</b></p> <p>On the one hand you have that higher mercury levels lead to negative birth outcomes and on the other hand stress can also lead to negative birth outcomes. It could be that people in the interior experience more stress and that they have both more stress and higher mercury levels. Did you check for stress when you did the mercury analysis?</p>  | <p><b>Anisma Gokoel:</b></p> <p>A model with stress, mercury and other socio-demographic factors such as income was used during the research.</p>   |
| 6. | <p><b>Camp Mining – Melleo Naana:</b></p> <p>The greatest mercury pollution in Suriname was before the creation of the Brokopondo reservoir. As young people from Nieuw Koffiekamp, we used to go looking for mercury along the railway line to sell for the gold diggers. Mercury pollution is not something from now, but from years ago. It must also be investigated why there was so much mercury in Suriname before the creation of the reservoir sixty years ago.</p> |   |

|           |  |  |
|-----------|--|--|
| <p>7.</p> | <p><b>Alliance for Responsible Mining – Johannes Abielie:</b></p> <p>a. We also did a baseline study of mercury occurrences in the physical environment as well as in humans and we measured generally low levels in people in the Brokopondo district. The French research institute IRD took samples and what we can conclude from the results is that mercury accumulated in the food chain is more easily found in people's bodies. You hardly see any mercury in the body of the person who works with mercury, but mercury can be traced in the person who eats food that is contaminated with mercury. In that case the health impact is greater. In one of the villages, ten of the twelve samples had an elevated mercury contamination, a few of which had eight to nine times the acceptable value. Those people are not that closely involved in small-scale gold mining, but if you look at their dietary habits, they do have an association with the Brokopondo reservoir.</p> <p>b. The largest source of mercury contamination in Suriname was the chimney of Alcoa's smelter. All the gold that is mined in Suriname is processed in a small part of Paramaribo North, so you can imagine how concentrated the contamination of mercury in the air is in Paramaribo North.</p> |  |
| <p>8.</p> | <p><b>Arioene Vreedzaam</b></p> <p>I'm also doing a mercury study looking more at the environment. We may be coming out this year with publications on mercury measurements in the hair of women, mercury in fish, water and river sediment. We found very high levels of mercury in Apoera, Sipaliwini and Kwamalasemutu, Palumeu and Apetina.</p>  |  |

|    |  |  |
|----|--|--|
| 9. | <p><b>NIMOS - Donovan Bogor:</b></p> <p>We also planned to go deeper into the possible mercury depositions in Suriname where we wanted to determine the age of mercury and establish if it is Surinamese mercury or mercury from abroad. Hopefully we will get the funding available to carry out this research.</p> |  |
|----|--|--|

## Presentation 2: “Rosebel Gold Mines NV management of Small Scale Mining”

In this presentation, Rosebel Gold Mines’ representative, Mrs. Marijke Agwense, gives an overview of the various initiatives that have been carried out by Rosebel Gold Mines in the surrounding areas of the Rosebel concessions where the small-scale miners are active. For more information on the presentation please contact Mrs. Agwense (see info in the registration list).

| No. | Questions / Comments   | Answers  |
|-----|--|--|
| 1.  | <p><b>Anton de Kom University – Rene Artist:</b></p> <p>Have you noticed a correlation between the movement of small scale miners' activities on the concessions and the gold price?</p> | <p><b>Marijke Agwense:</b></p> <p>The gold price has something to do with it, but it's not that significant. It's only one of the aspects.</p>   |
| 2.  | <p><b>Chantal Landburg:</b></p> <p>You indicated that finances are a problem. Can you explain that in more detail.</p>   | <p><b>Mary Agwense:</b></p> <p>Mercury free mining is still trial and error and you need to have the funds available to keep investing in new methods. The budget of the Community Relations department is often informed by activities we do in the communities. With small scale mining it is more social risk management and there isn't a large budget available for this.</p> |

|           |   |  |
|-----------|---|--|
| <p>3.</p> | <p><b>Artisanal Gold Mining – Marieke Heemskerk:</b><br/>                 We have heard in the media that Rosebel Gold Mines has been sold to Zijin Mining Group. The experience with mines owned by Chinese mining companies in various African countries is that the health and safety standards, but also the community relations standards, are significantly different from those of a Canadian company. What will the acquisition mean for the community relations plans you have for the future.</p> | <p><b>Yoanne Najoe:</b><br/>                 At the moment we do not know more than what has been reported in the media. I think we should embrace the change and see what it brings us.</p>   |
| <p>4.</p> | <p><b>Camp Mining – Melleo Naana:</b><br/>                 As Camp Mining we would like to express a special word of thanks to Rosebel Gold Mines for the experience gained in recent months. Can you share this working method with Newmont so that they can also implement what has been done in Nieuw Koffiekamp in Marowijne.</p>   | <p><b>Yoanne Najoe:</b><br/>                 For every organization it is about finding out what works best for them given their situation and operation. We are willing to enter into partnerships with our peers if the need arises. It will mainly depend on their own situation, challenges and if they see value in our working method.</p> |

**Presentation 3: “Mercury background values in soils and saprolites in the gold-rich greenstone belt of Suriname, Guiana Shield: The role of parent rock and residual enrichment”**

In this presentation, Prof. Kroonenberg, explains the results of an assessment of mercury levels within gold bearing geological formations of Suriname.

See annex 2 for the presentation.

| No. | Questions  | Answers   |
|-----|--|---|
| 1.  | <p><b>Alliance for Responsible Mining - Yves Bertrand:</b><br/>Despite of the low levels of mercury that you found on artisanal and small scale mining sites, do you think that remobilizing the saprolites with milling and processing will also remobilize the mercury and have an influence on the mercury levels in the streams?</p> | <p><b>Salomon Kroonenberg:</b><br/>What we see in the streams could be largely materials from the saprolites and top soil. Even though we see increasing mercury levels in the younger sediments, it can be the result of recent mining and not necessarily the result of mercury pollution. You also see it in the quality of the sediment if you look at the unpolluted rivers than the sediment is grey but if you look at the rivers that have material that comes from the mines, the sediment is red.</p> |
| 2.  | <p><b>Alliance for Responsible Mining - Johannes Abielie:</b><br/>In the baseline that we did we found high levels of mercury concentration in people that consume fish from the Brokopondo reservoir. Why do you think that there is such a high concentration of mercury in the Brokopondo lake?</p>                                   | <p><b>Salomon Kroonenberg:</b><br/>The material in the creeks come from the mountains and rocks so there is reason to believe that you wont find the same results from the mountains in the creeks.</p>   |

|    |   |  |
|----|---|--|
| 3. | <p><b>NIMOS - Donovan Bogor:</b></p> <p>Professor Kroonenberg's research is part of a three-part study. An important part that is now performed by Mrs. Wesenhagen in collaboration with Mr. Wip has to do with the air pollution in Paramaribo. The research is still ongoing and hopefully we will receive the results very soon.</p> |  |

**Next meeting**

The EMSAGS Project Management Unit proposes to have the next meeting in February 2023. A report of the current meeting, including the presentations, will be shared with the members of the Stakeholders Platform and on the EMSAGS website.

**Closing**

In her closing remarks, the Permanent Secretary of the Ministry of Natural Resources, Mrs. P. Simons, thanks the attendees and presenters for their attendance. The Ministry of Natural Resources is well aware of the mercury use in Suriname and is pleased with the various studies that are currently being done in the context of mercury pollution. Suriname has committed itself to the Minamata Convention and the EMSAGS project is one of the ways in which we want to give substance to this. The use of mercury occurs all over the world and foreign countries are much further than Suriname when it comes to implementing environmentally responsible techniques. Finding environmentally responsible techniques does not happen overnight. Together with the small scale miners, we want to see which method we can identify and thus limit the use of mercury in Suriname.

**Annex 1**

**Presentation 1: “The influence of prenatal exposure to non-chemical and chemical stressors on birth outcomes in Suriname”**

**THE INFLUENCE OF PRENATAL EXPOSURE TO  
NON-CHEMICAL AND CHEMICAL STRESSORS ON  
BIRTH OUTCOMES IN SURINAME**

**ANISMA GOKOEL**

**DISCLAIMER**

This research was funded by the Fogarty International Center of the National Institutes of Health (NIH), grant numbers U01TW010087 and U2RTW010104

## BACKGROUND

- The prevalence of preterm birth (PTB) and low birthweight (LBW) in Suriname: respectively 14% and 15% (2016&2017) (Verschueren et al. 2020)
- Pregnant women may be exposed to multiple environmental factors at once: non-chemical and chemical stressors (Pao et al. 2019; Vesterinen 2017)
- Suriname: (1) Use of mercury (Hg) in goldmining (ASGM), (2) High levels of Hg in hair (above USEPA action level) in women and children living in the Interior (3) 19.5% mental distress, particularly in (among others) participants of Tribal descent and living in urban areas, (Ouboter et al. 2012), (Ouboter et al. 2018; Mohan et al. 2005), (Gunther et al. 2017)
- No studies have been conducted to examine the influence of non-chemical and chemical exposures on birth outcomes in Suriname

## RESEARCH GOAL

5

**Examine the influence of prenatal exposure to non-chemical and chemical stressors in pregnant women on birth outcomes**

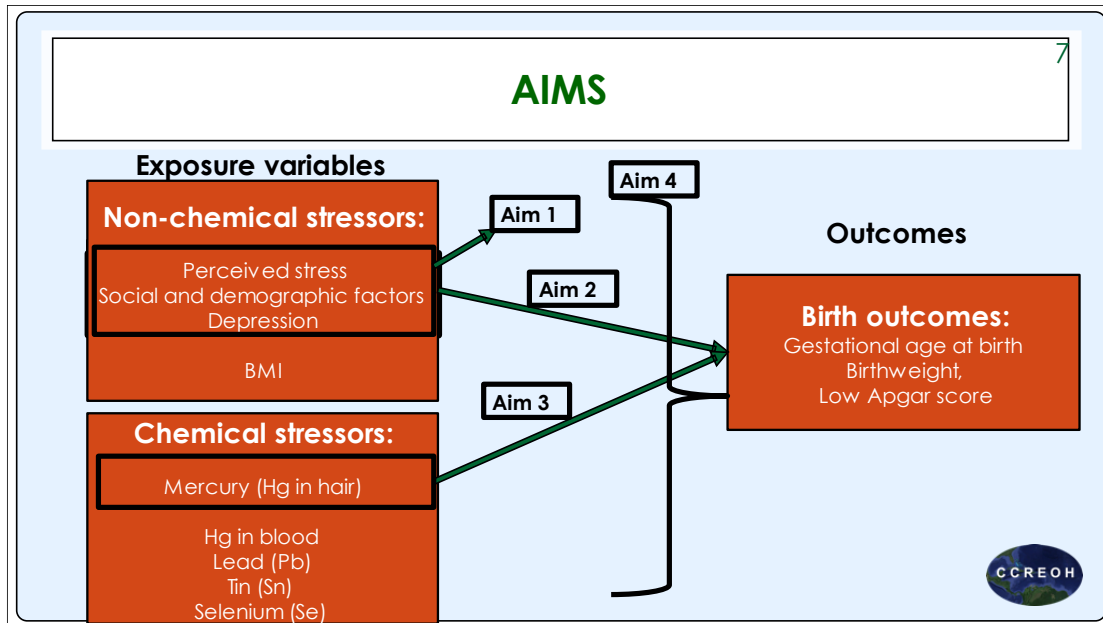

## HYPOTHESIS

6

**Prenatal exposure to non-chemical and chemical stressors in pregnant women negatively influences birth outcomes**

- ### METHODS
- Caribbean Consortium for Research in Environmental and Occupational Health (CCREOH MeKiTamarastudy)
  - Prospective environmental epidemiologic cohort study which addresses the impact of chemical and non-chemical environmental exposures on mother/child dyads in Suriname
  - A total of 1200 participants were included from December 2016-September 2020
  - Recruitment sites: 5 hospitals (Academic Hospital Paramaribo, Diakonessenhuis Hospital, 's Lands Hospital, St. Vincentius Hospital, Mungra Medical Centre), prenatal health facilities of the Regional Health Department and the Medical Mission Primary Health Care Suriname
  - Inclusion criteria: 16 years or older, spoke Dutch/Saramaccan, or Trio, singleton gestation, planning to give birth at one of the study sites, provided written informed consent/assent
-

## CARIBBEAN CONSORTIUM FOR RESEARCH IN ENVIRONMENTAL AND OCCUPATIONAL HEALTH (CCREOH) RECRUITMENT SITES & NUMBERS (N=1200)

### Demographics study population:

- **Region:**  
Paramaribo: 768  
Nickerie: 224  
Interior: 208
- **Age:** 16-49 years
- **Ethnicity:**  
Creole: 21.8 %  
Hindustani: 19.7%  
Indigenous: 10.8%  
Javanese: 7.1%  
Maroon: 21.9%  
Mixed: 18.6%

AIM1: CHARACTERIZE THE INFLUENCE OF PERCEIVED STRESS, SOCIAL- AND DEMOGRAPHIC VARIABLES ON DEPRESSION DURING PREGNANCY; **METHODS**

- 1<sup>st</sup> or 2<sup>nd</sup> trimester: data of 1143 participants
- 3<sup>rd</sup> trimester: data of 743 participants
- Questionnaires: three self-report questionnaires
  1. Social Support List-Interactions-12 (SSL-I-12)
    - SSL-I-12 assesses social support (support, affection, and attention from family and friends)
    - median scores used as cutoff points (higher scores=>high social support)

14  
**AIM1: CHARACTERIZE THE INFLUENCE OF PERCEIVED STRESS, SOCIAL- AND DEMOGRAPHIC VARIABLES ON DEPRESSION DURING PREGNANCY; METHODS CONT'D**

2. Cohen's Perceived Stress Scale (PSS)

- PSS assesses perceived stress (e.g. the degree of experiencing stress due to having no control over things)
- total score ranges from 0 (lowest stress level) to 40 (highest stress level) points; cut-off of  $\geq 20$  points for high perceived stress (75<sup>th</sup> percentile)

3. Edinburgh Postnatal Depression Scale (EPDS)

- assesses postnatal depression, but has been validated for use prenatally (EDS) (anxiety and depression symptoms)
- sum score of all statements: 0 to 30 points (higher score means higher risk on probable depression); cut-off point of  $\geq 12$  points for probable depression

15  
**AIM1: CHARACTERIZE THE INFLUENCE OF PERCEIVED STRESS, SOCIAL- AND DEMOGRAPHIC VARIABLES ON DEPRESSION DURING PREGNANCY**

- Probable depression during the 1<sup>st</sup>/2<sup>nd</sup> and 3<sup>rd</sup> trimester: respectively **22.4%** and **17.6%** (Gokoel et al. 2021)
- **Throughout pregnancy, almost half of the pregnant women with high perceived stress levels had probable depression** (Gokoel et al. 2021)

| Variables   | 1 <sup>st</sup> /2 <sup>nd</sup> trimester |         | 3 <sup>rd</sup> trimester |         |

## Influence of perceived stress on prenatal depression in Surinamese women enrolled in the CCREOH study

Anisma R. Gokoel<sup>1,3\*</sup> , Firoz Abdoel Wahid<sup>1,2</sup>, Wilco C. W. R. Zijlmans<sup>2,3,4</sup>, Arti Shankar<sup>2</sup>, Ashna D. Hindori-Mohangoo<sup>2,4</sup>, Hannah H. Covert<sup>2</sup>, Meerte-Sigrid MacDonald-Ottevanger<sup>1,5</sup>, Maureen Y. Lichtveld<sup>6</sup> and Emily W. Harville<sup>7</sup>

## Results

### Aims 2 & 3:

Assess the impact of prenatal exposure to **perceived stress** and **depression** on **birth outcomes** (PTB, LBW and low Apgar score)

&amp;

Assess the impact of prenatal exposure to **mercury** on **birth outcomes** (PTB, LBW and low Apgar score)

17

AIM 2&3: ASSESS THE IMPACT OF PRENATAL EXPOSURE TO PERCEIVED STRESS, DEPRESSION AND MERCURY ON BIRTH OUTCOMES; **METHODS**

18

- **Questionnaires:**

- Cohen's Perceived Stress Scale (PSS) (cut-off point 75th percentile)
- Edinburgh Depression Scale (EDS) (cut-off point  $\geq 12$  points)

- **Birth outcome variables:**

- low birthweight:  $< 2,500$  g
- preterm birth: before 37 completed weeks of gestation
- low Apgar score:  $< 7$  at 5 min

- **Hair mercury:** cut-off elevated mercury levels:  $\geq 1.1$   $\mu\text{g/g}$ , US Environmental Protection Agency (US EPA) action level

AIM 2&3: ASSESS THE IMPACT OF PRENATAL EXPOSURE TO PERCEIVED STRESS, DEPRESSION AND MERCURY ON BIRTH OUTCOMES

19

- Prevalence of preterm birth (PTB), lowbirthweight (LBW) and low Apgar score were respectively: 15.2%, 13.2% and 3.3% (Gokoel et al. 2020)
- Perceived stress was associated with low Apgar score (OR 9.73;  $p=0.004$ ) (Gokoel et al. 2020)
- Elevated hair mercury levels were significantly associated with preterm birth (OR 2.47;  $p=0.039$ ) (Gokoel et al. 2020)

**AIM 2&3: ASSESS THE IMPACT OF PRENATAL EXPOSURE TO PERCEIVED STRESS, DEPRESSION AND MERCURY ON BIRTH OUTCOMES**

20

### Aim 4:

Examine the **cumulative exposure** to **non-chemical stressors** (perceived stress, depression, BMI) and **chemicals** (Hg, Pb, tin (Sn), Se) on **birth outcomes** (GA, BW, Apgar score)

AIM 4: EXAMINE THE CUMULATIVE EXPOSURE TO NON-CHEMICAL STRESSORS AND CHEMICALS ON BIRTH OUTCOMES; **METHODS**

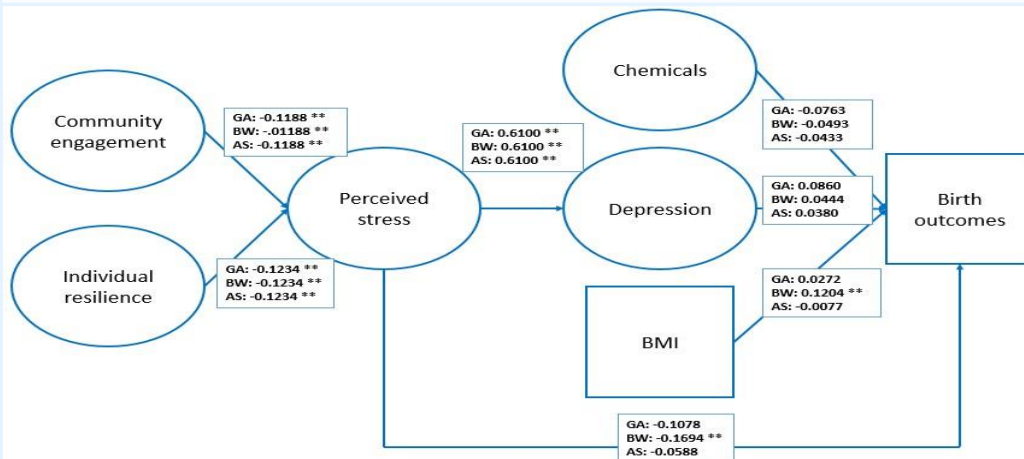

23

- 384 participants included
- Exposures:
  - Chemicals: (mercury (Hg), lead (Pb), selenium (Se), tin (Sn))
  - Perceived stress, probable depression, and social support
- Demographic variable: BMI
- Birth outcomes: gestational age at birth, birthweight and Apgar score

AIM 4: EXAMINE THE CUMULATIVE EXPOSURE TO NON-CHEMICAL STRESSORS AND CHEMICALS ON BIRTH OUTCOMES; RESULTS: PATH MODEL OF RELATIONSHIPS AMONG NON-CHEMICAL STRESSORS, THE LATENT CHEMICAL CONSTRUCT, AND BIRTH OUTCOMES 24

## OVERALL DISCUSSION

26

- Hypothesis: "Prenatal exposure to non-chemical and chemical stressors in pregnant CCREOH women negatively impact birth outcomes"  
Based upon the results of the aims, the study hypothesis was accepted
- The prevalences of preterm birth (PTB) (15.2%) and low birthweight (LBW) (13.2%) were higher than the regional average of PTB (9.5%) and LBW (10%) of Latin American and the Caribbean countries
- No association was found between prenatal depression and adverse birth outcomes- screening instrument was used instead of clinical diagnosis to assess depression

## OVERALL DISCUSSION CONT'D

27

- Participants with elevated hair mercury levels ( $\geq 1.58 \mu\text{g/g}$ ) had a greater risk of giving birth before 37 weeks of gestation compared to women with lower hair mercury levels ( $\leq 0.46 \mu\text{g/g}$ )
- High likelihood of hair mercury exposure in pregnant women of Indigenous (OR 17.9;  $p \leq 0.001$ ) and Tribal (OR 3.7;  $p \leq 0.00$ ) descent compared to Hindustani women
  - people living in the interior largely depend on riverine fish for a protein source
- No association between the chemical latent construct and any birth outcomes
  - Non-chemical stressors outweighed other effects (dominant role), protective effect of Se

## STRENGTHS AND LIMITATIONS

28

- Strengths:
  - first study in Suriname examining the effect of non-chemical stressors and a unique combination of chemical exposures on birth outcomes
  - study population is a reasonably good representation of pregnancies in Suriname (large study population, ethnic and cultural diversity, several socio-demographic factors and the geographic diversity)
- Limitations:
  - psychosocial questionnaires were not validated for Suriname before data collection
  - Edinburgh Depression Scale is a screening tool and not a diagnostic tool

## RECOMMENDATIONS

29

### Implications for practice:

- A task shifting approach for health care

### Implications for policy:

- Strengthen and enforce policies and laws regarding mercury use, ensure adequate monitoring of mercury use in goldmining to protect inhabitants

### Implications for science:

- Other risk factors for perceived stress and depression (e.g., unintended pregnancies, domestic violence, and prenatal care utilization, influence of communicable and non-communicable diseases, culture)

Analytical results per rock unit

Hg values for soils and saprolites per major rock group

Quartz-feldspar -rich      Iron-magnesium -rich

Highest Hg values in individual profiles, plotted on geological map, highest in Paramaka (green)

### Phase 3: comparison with existing Hg values from pristine and polluted material

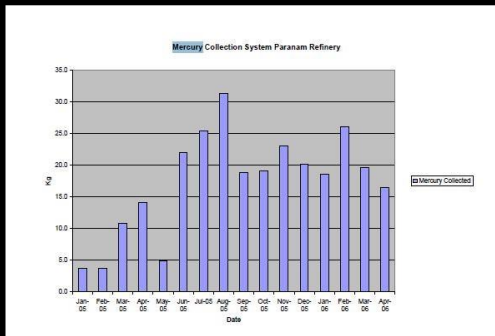

1 ppb (part per billion)  
 = 1 ng g<sup>-1</sup>  
 = 1 μg kg<sup>-1</sup>

Mercury contents in uncontaminated **hard rock** drill cores from lamgold Rosebel Gold Mines

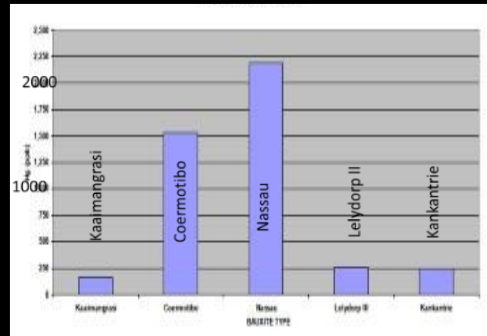

Only 39 out of 113 samples have Hg values above detection limit (5 ppb Hg, MIMS42)

### Mercury in bauxite: also residual enrichment

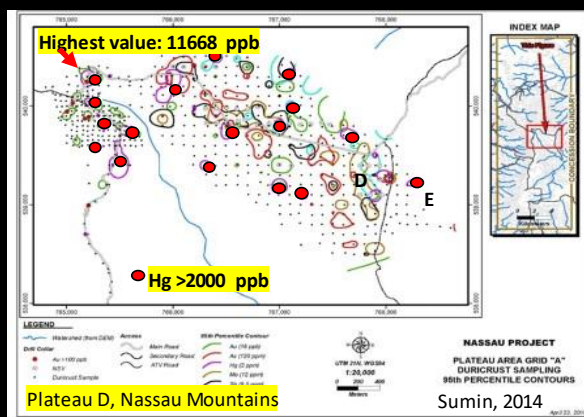

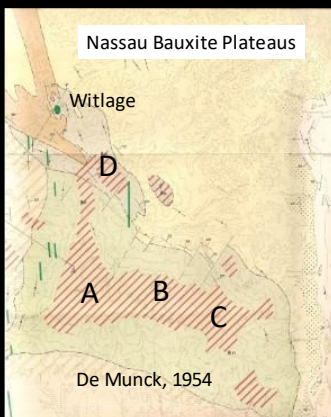

In 2005 Suralco retrieved 200 kg mercury from bauxite refinery

Hg values for different types of bauxite in Suriname

Data: Suralco Source: Bauxite institute Suriname

### Mercury values of Nassau Mountains bauxites

Cinnabar (HgS, mercury ore) in Witlage gold placer, Nassau Mountains

Headley, 1913; Duyfjes, 1915; IJzerman, 1931; Billiton, 1953; Capps, 2004; Kroonenberg, 2019.

Mercury contents in tailings from Gros -Rosebel gold mines, 2002

|                                      |                 |
|--------------------------------------|-----------------|
| Mine waste                           | 5.5-200 ppb Hg  |
| Sediment in streams below mines      | 110 -150 ppb Hg |
| Uncontaminated baselines (worldwide) | 14-18 ppb Hg    |

Correlation Hg and methyl Hg in Rosebel sediments

Gray et al., 2002, Geoph Res. Letters

Same order of magnitude as in pristine soils and saprolites

Hg values in Witi Creek gold area, Brownsberg. Arets et al., 2006, ALTERRA

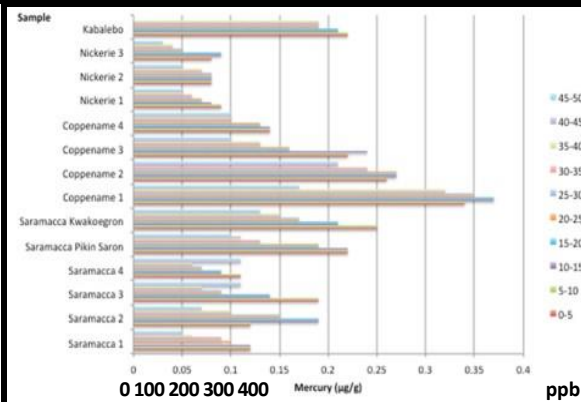

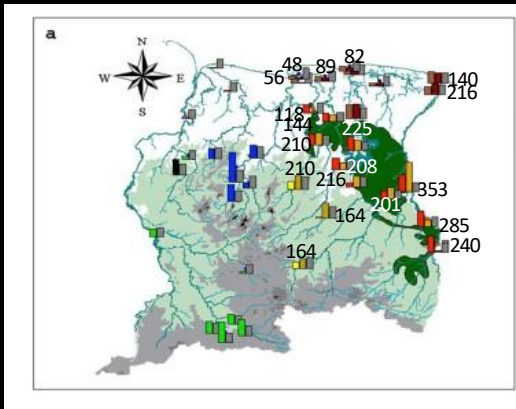

| Brownsberg                          | Hg ppb |
|-------------------------------------|--------|
| Average soil primary forest (n=4)   | 200    |
| Average soil secondary forest (n=4) | 200    |
| Average in between pits (n=7)       | 200    |
| Average sediment sluice box (n=8)   | 780    |
| Average sediment in pit (n=6)       | 250    |
| Average sediment in entrance (n=3)  | 310    |
| Average sediment exit pit (n=3)     | 300    |

Same order of magnitude as in pristine soils and saprolites

Hg values in river sediments in Suriname

Average contents of Hg (ppb) in river sediments 2004-2005 (data and map from Ouboter et al., 2012, 2015)

Decrease of Hg contents with depth in river sediments in Western Suriname (Ouboter et al., 2015)

Same order of magnitude as in pristine soils and saprolites

Mercury background values in soils and saprolites in the gold-rich greenstone belt of Suriname, Guiana Shield: The role of parent rock and residual enrichment

Salomon Kroonenberg <sup>\*,\*\*</sup>, Theo Wong, Ginny Bijnaar, Ramon Finkie, Kenneth Goenopawiro, Samjhawan Asneel, Morgan Lin-Tsung, Rivano Nanan, Kishan Ramdas, Prisan Sitaram

*Anton de Kam University of Suriname, Department of Geosciences, Paramaribo, Suriname*

Possible follow-up research

- Detailed study correlation Hg with clay, org. matter in test profiles
- Hg isotopes, binding with mineralogy (hematite/goethite, Mn oxides)
- Redox conditions in anoxic groundwater

Detailed Hg isotope graph for soils and sediments (Blum et al., 2014)

IN BRIEF WHAT WE DO WHERE WE WORK PARTNERS JOIN US RESOURCES

Home > International Geoscience Programme (IGCP) > IGCP Projects > Project 696 - Impacts from Artisanal and Small-Scale Gold Mining in the Amazon

## Project 696 - Impacts from Artisanal and Small-Scale Gold Mining in the Amazon

Project 696 - Impacts from Artisanal and Small-Scale Gold Mining in the Amazon

**Brief outline of the project**

Largely because of use during the exploitation of gold, mercury is a health concern in many regions of the developing world including the Amazon. Mercury use and release is associated with artisanal and small-scale gold mining (ASGM), which is done by individuals or groups of miners mostly operating informally with little to no regulation.

### UNESCO-IGCP programme, starts summer 2022

Dr. Bridget A. Bergquist (University of Toronto, Canada)

## Conclusions

- (1) Primary hardrock: low values, Hg < 12 ppb
- (2) Topsoils and iron-cemented horizons residually concentrate Hg up to 100-200 ppb, together with Fe, Cr, V. Extreme residual values in bauxite (commonly 2000 ppb, highest 12000 ppb)
- (3) Deeper horizons (mottled, pallid zones) are depleted to low levels (Hg < 1 ppb)
- (4) Range of values within individual profiles is higher than between profiles
- (5) Fe-rich parent rocks have higher Hg in topsoils than quartz-feldspar-rich rocks

## Implications

- (1) Unpolluted (top)soils and saprolites have Hg values in the same range as stream sediments and mine tailings. This method is unsuitable to distinguish polluted samples from pristine ones. Probably isotope studies are necessary.
- (2) Hg in soil and saprolite is probably not a hazard as long it remains bound to Fe-oxides in oxidized environments. Conversion to methyl-Hg requires reducing conditions e.g. in groundwater and mine pits. So avoid stagnant water in gold-mining areas!
